This guide aims to provide an in-depth, structured overview of the core topics covered in the pre-test, offering clarity and confidence to learners undertaking this assessment.

What is Electrochemistry?

Electrochemistry studies how chemical reactions produce electrical energy and vice versa. It encompasses various phenomena, including oxidation-reduction (redox) reactions, electrolysis, galvanic cells (batteries), and standard electrode potentials. Mastery of these concepts is essential for understanding energy transfer in chemical processes, modern energy storage, and many industrial applications.

Core Topics Covered in the Pre-Test

The Unit 5 Electrochemistry Pre Test typically assesses understanding across several key areas:

- Redox reactions and balancing
- Oxidation numbers
- Electrochemical cells (galvanic/voltaic cells)
- Cell notation

- Standard electrode potentials and the electrochemical series
- Calculation of cell potentials
- Electrolysis and applications
- Factors affecting electrochemical reactions

Let?s explore each of these areas in detail.

Redox Reactions and Balancing

What are Redox Reactions?

Redox reactions involve the transfer of electrons between species, resulting in oxidation (loss of electrons) and reduction (gain of electrons). Recognizing and balancing these reactions is fundamental for the pre-test.

How to Identify Oxidation and Reduction

- Oxidation: Increase in oxidation number
- Reduction: Decrease in oxidation number

Techniques for Balancing Redox Equations

- Oxidation Number Method: Assign oxidation states and balance electrons accordingly.
- Half-Reaction Method: Separate into oxidation and reduction half-reactions, balance separately, then combine.

Example

Balance the reaction:

`Fe + Cu²? ? Fe³? + Cu`

Step-by-step:

- Write half-reactions:

- Oxidation: Fe ? Fe³? + 3e?

- Reduction: $Cu^{2?} + 2e? ? Cu$

- Equalize electrons:

- Multiply oxidation half-reaction by 2:

$2Fe ? 2Fe^{3?} + 6e?$

- Multiply reduction by 3:

$3Cu^{2?} + 6e? ? 3Cu$

- Add:

$2Fe + 3Cu^{2?} ? 2Fe^{3?} + 3Cu$

Oxidation Numbers

Importance in Electrochemistry

Oxidation numbers help identify what species are oxidized or reduced and are crucial in writing balanced redox equations and understanding cell reactions.

Rules for Assigning Oxidation Numbers

- Elements in their standard state: 0
- Monoatomic ions: equal to their charge
- Oxygen: typically -2
- Hydrogen: +1 when bonded to non-metals
- Sum of oxidation numbers in a neutral compound: 0
- Sum in a polyatomic ion: equal to its charge

Practice

Determine the oxidation number of chromium in `$Cr?O?^{2?}$`:

- Let x = oxidation number of Cr
- Sum: 2x + 7(-2) = -2
- 2x -14 = -2
- 2x = 12
- x = +6

Chromium in `Cr?O?²?` is +6.

Electrochemical Cells: Galvanic and Electrolytic Cells

Galvanic (Voltaic) Cells

- Generate electrical energy from spontaneous chemical reactions.
- Consist of two half-cells connected by a wire and salt bridge.
- Examples: batteries, dry cell.

Electrolytic Cells

- Use electrical energy to drive non-spontaneous reactions.
- Used in electroplating and electrolysis.

Cell Components and Notation

- Anode (oxidation site)
- Cathode (reduction site)
- Salt bridge or porous barrier
- Cell notation format: `[Anode | Anode solution || Cathode | Cathode solution]`

Example: Daniell Cell

Zn | Zn²? || Cu²? | Cu

Standard Electrode Potentials and the Electrochemical Series

Standard Electrode Potentials (E°)

- Measure the tendency of a species to be reduced.

- Values are referenced against the Standard Hydrogen Electrode (SHE, assigned 0 V).

Interpreting E°

- Positive E°: species is more likely to be reduced.
- Negative E°: species less likely to be reduced.

Electrochemical Series

- Arranged from most easily reduced to least.
- Guides predictions about reaction spontaneity.

Example of Standard Potentials

| Half-Reaction | E° (V) |

|---|---|

| 2H? + 2e? ? H? | 0.00 |

| Cu²? + 2e? ? Cu | +0.34 |

| Ag? + e? ? Ag | +0.80 |

| Fe³? + e? ? Fe²? | +0.77 |

Calculating Cell Potentials

Cell Potential (E°cell)

- Calculated as:

`E°cell = E°cathode ? E°anode`

- For spontaneous reactions, E°cell should be positive.

Determining Spontaneity

- If E°cell > 0: reaction is spontaneous.
- If E°cell

Example Calculation

Given:

- Copper reduction: E° = +0.34 V
- Zinc reduction: E° = ?0.76 V (zinc is oxidized, so use the reverse)

For a zinc-copper cell:

`E°cell = 0.34 ? (?0.76) = 1.10 V`

Reaction is spontaneous.

Electrolysis and Its Applications

What is Electrolysis?

A process where electrical energy drives a non-spontaneous chemical reaction, useful in purifying metals, electroplating, and manufacturing chemicals.

Key Concepts

- Electrolyte: substance that conducts electricity via ions.
- Electrodes: conduct the current into and out of the electrolyte.
- Faraday?s Laws: quantify the relationship between charge passed and amount of substance produced.

Applications

- Electroplating jewelry and electronics
- Purification of copper
- Production of chemicals like chlorine and sodium hydroxide

Factors Affecting Electrochemical Reactions

- Temperature: Higher temperatures can increase reaction rates.
- Concentration: Affects cell potential and reaction rates.
- Surface Area: Larger electrode surface area increases current flow.
- Nature of Electrodes: Material and surface condition influence reactions.
